

Data Can Deceive

Causal Roadmaps with AI

Kathryn Andy Robert Auriane

August 5, 2026 · 12:00–12:20 ET

Module A: Welcome + Intro

PhD, PStat

Co-founder and President, Precision Analytics

Accredited statistician whose consulting spans genomics, clinical research, and statistical technology.

Today: opening context, causal foundations, audit-first AI, and calibration of the conclusions.

PhD, MStat

Adjunct Professor, University of Utah

Teaches Causal Methods in Public Health and co-develops the open-source Causal Navigator through Tao of RWD.

Today: the causal roadmap, live Navigator demonstration, and TMLE walkthrough.

PhD

Professor of Biostatistics, McGill University

Co-lead of the Canadian Network for Observational Drug Effect Studies, with a focus on pharmacoepidemiology using claims and EHR data.

Today: a concrete example of why the causal roadmap matters.

MScPH student

McGill University; President, UAEM McGill

Auriane supports the workshop's live delivery.

Today: screen share and production support, including the live Navigator session.

Before we begin

Chat prompt

*Which step in your current study
feels least defensible?*

Add one step or decision in the chat.

Workshop journey · 12:00–5:00 ET

A Welcome B Robert C Foundations D Roadmap E AI audit F Navigator G TMLE H Close

Example with Robert Platt

Module B

12:20–12:45 ET

- The research question
- Why the result looked persuasive
- What went wrong—and the consequence
- The roadmap safeguard

Module C

12:45–1:25 ET

- Association versus intervention
- Confounders, mediators, and colliders
- Target-trial protocol and time zero
- The pneumonia-vaccine paradox

Module D

1:35–2:20 ET

- Protocol and target trial
- DAG and common causes
- Identification and observed data
- Estimand, estimator, sensitivity, interpretation

Module E

2:20–2:45 ET

- Review an AI-generated roadmap field
- Accept, correct, or reject it
- Name the evidence required
- Record the decision

Module F

3:15–4:10 ET

- Start from a prepared study
- Work through all eight steps
- Pause for key design decisions
- Export the study summary

Module G

4:20–4:55 ET

- Start from the estimand defined upstream
- Compare crude, g-computation, IPW, and TMLE
- Review the targeting update
- Inspect overlap and remaining limits

Module H

4:55–5:00 ET

- Protocol, roadmap, audit, estimation
- Participant workshop kit
- Worked example
- What will you change before your next model is fit?
