

Data Can Deceive

Causal Roadmaps with AI

Module A · Welcome + Intro

August 5, 2026 · 12:00–12:20 ET

Welcome from Kathryn, Andy, Robert, and Auriane

PhD · PStat

Co-founder and President, Precision Analytics

Accredited statistician with more than twenty peer-reviewed publications. Her consulting spans genomics, clinical research, and statistical technology.

In this workshop: opening context, causal foundations, audit-first AI, and calibration of the conclusions.

PhD · MStat

Adjunct Professor, University of Utah

Teaches Causal Methods in Public Health and co-develops the open-source Causal Navigator through Tao of RWD.

In this workshop: the causal roadmap, live Navigator demonstration, and TMLE walkthrough.

PhD

Professor of Biostatistics, McGill University

Co-lead of the Canadian Network for Observational Drug Effect Studies (CNODES), with a focus on pharmacoepidemiology using claims and EHR data.

In this workshop: a concrete example of why the causal roadmap matters.

MScPH student

McGill University · President, UAEM McGill

Auriane supports the workshop's live delivery.

In this workshop: screen share and production support, including the live Navigator session.

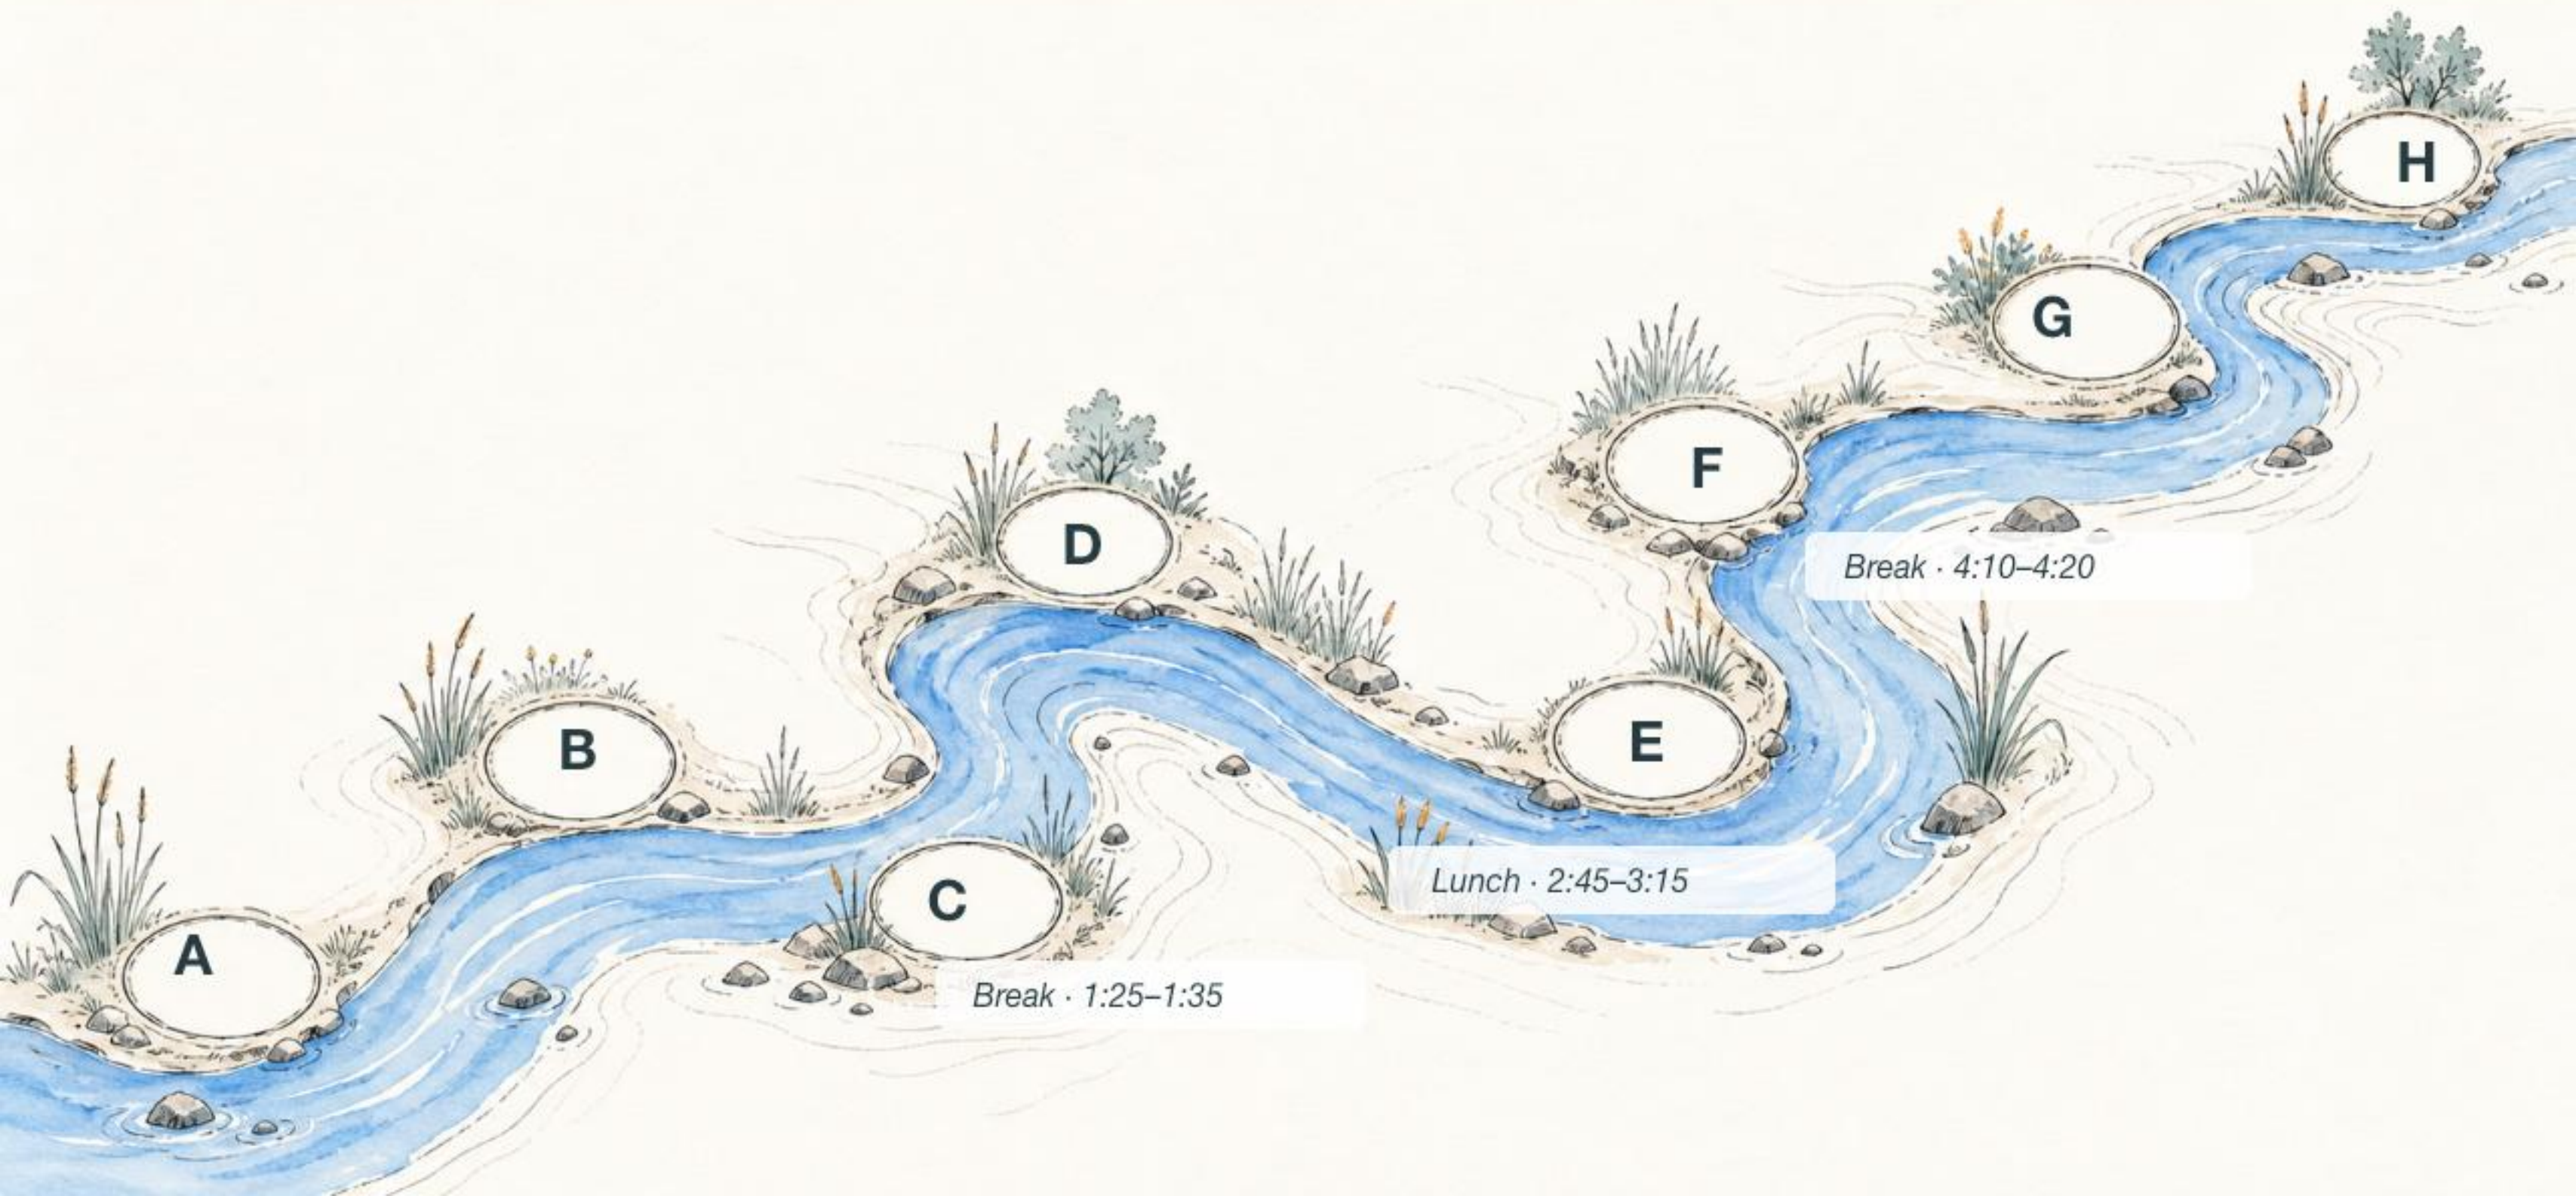

Chat prompt

*Which step in your current study
feels least defensible?*

Add one step or decision in the chat.

Workshop journey · 12:00–5:00 ET

A Welcome B Robert C Foundations D Roadmap E AI audit F Navigator G TMLE H Close

B

- The research question
- What looked persuasive
- What went wrong — and the consequence
- Where the failure sits in the eight-step Navigator

C

- Association versus intervention
- Counterfactual contrasts; confounders, mediators, and colliders
- Target-trial protocol and time-zero alignment
- Pneumonia-vaccine example and its crude paradox

D

- Protocol: population, strategies, time zero, follow-up, outcome, contrast
- DAG: measured and unmeasured common causes
- Observed-data mapping and identification assumptions
- Estimand, estimator, sensitivity plan, and interpretation

E

- Review an AI-generated roadmap field
- Accept, correct, or reject it
- Name the evidence required
- Record the decision in the audit log

F

- Start from Quick Start using the no-login manual route
- Complete eight steps from prepared entries
- Use AI Copilot once, if the presenter account is ready
- Export the study summary

Discussion pauses: treatment strategy · unmeasured confounding · interpretation

G

- Start from the estimand already defined in Navigator
- Compare crude, g-computation, IPW, and TMLE estimates
- Review the outcome model, treatment model, and targeting update
- Inspect overlap and state what TMLE cannot repair

H

- Protocol · roadmap · audit · estimation · interpretation
- Participant workshop kit
- Right-heart-catheterization worked example
- Exit question: What will you change before your next model is fit?
