

Module H: Wrap-up

A short recap, resources, and thanks

Data Can Deceive: Causal Roadmaps with (and without) AI

August 5, 2026 · 4:55–5:00 PM ET

Kathryn Morrison · Andy Wilson

One question, one defensible chain

1. Start with the causal question and target trial.

Define the population, strategies, outcome, time zero, follow-up, and contrast before choosing a model.

2. Make the assumptions visible.

Connect the causal model and data to identification conditions and the adjustment strategy.

3. Match the estimand, estimator, and diagnostics.

Estimate the quantity you defined; inspect positivity, model behavior, uncertainty, and sensitivity.

4. Keep the interpretation inside the evidence.

State what the estimate supports, what it does not, and the evidence that would make you revise the claim.

AI can assist with drafting and challenge; people remain responsible for the science and the claim.
